Tokio: cfg-gated select!

Technical project delivery and software quality

> “I've determined your approach probably works. I'll review this once v1.54.0 is out.”

THE PROBLEM

Tokio is a Rust runtime for asynchronous applications. Its **select!** macro waits on multiple operations. A feature request opened in July 2021, labeled **E-hard**, asked for individual branches to be compiled in or out by configuration. Earlier attempts encountered fairness and parsing problems.

MY CONTRIBUTION

I led problem framing, implementation coordination, validation, and review follow-through. The submitted patch filters disabled branches before generating storage and polling code, with regression coverage for the earlier fairness and grammar cases.

THE EVIDENCE

The initial contribution has held up. All six contribution files remain byte-identical between the initial feature commit and the current head. The later commit merged upstream changes.

Verification is inspectable. CI and Stress Test runs passed for the submitted head. Diagnostic probes with 10 and 64 enabled cfg branches produced one final **select!** body on Rust 1.88.0 and 1.98.1. These are bounded measurements of the expansion concern.

STATUS AT OCTOBER 13, 2026

Open and awaiting review. Positive preliminary assessment; not yet merged.
