Chris McNosky

TECHNICAL PROJECT DELIVERY / SOFTWARE QUALITY

Dallas–Fort Worth, TX | 817-360-0687 | cmcnosky@gmail.com

Why Hire Me: cmcnosky.github.io/why-hire/ / LinkedIn / GitHub

Makes difficult, unfamiliar problems solvable and carries the work through to results that hold up. Defines requirements, coordinates implementation and separate review, and follows corrections through acceptance. Contributions accepted by Tokio and Grafana demonstrate this approach, alongside experience in purchasing, business operations, research, and software quality.

Selected results

Tokio / Rust feature accepted upstream · October 2026

- Led delivery of a five-year-old feature request rated hard by maintainers. Defined conditional select! behavior, directed implementation and regression coverage, and answered maintainer concerns with compiler measurements.

Accepted contribution · PR #8374

Grafana / Shared-link repair accepted upstream · September 2026

- Directed a repair for incorrect organization identifiers in shared links. Covered self-hosted, Cloud, and custom-path behavior with five regression cases, and followed the correction through maintainer review and merge.

Accepted contribution · PR #131070

Professional experience

Cleargrain Docs | Founder | 2026–present

- Translate unfamiliar requests into scope, deliverables, failure cases, acceptance criteria, and handover requirements. Coordinate implementation and separate review; require correction when evidence does not support acceptance.
- Published eight public-source work samples covering spreadsheet cleanup, supplier reporting, research comparisons, and written procedures, with downloadable files and documented checks.
- Co-created and released Read Shruti, a three-book author website using Next.js/React, TypeScript, Cloudflare Workers, and D1, with retailer links, search metadata, and aggregate analytics.

High Pie | Founder and Sole Operator | October 2022–present

- Run sourcing, purchasing, production, pricing, inventory, fulfillment, and customer issue resolution for a hemp-product business; maintain compliance documentation.

Lennar | Purchasing Coordinator | May 2018–October 2022

- Reconciled discrepancies across bids, contracts, budgets, and vendor records before field execution. Coordinated vendors, trades, and internal teams against construction deadlines and cost, quality, and documentation requirements.

Core skills

Requirements and acceptance criteria · Technical project coordination · Regression and adversarial testing · Failure analysis · Evidence review · Git/GitHub and CI · Data reconciliation · Excel, Power Query, and Power Pivot · Research and source evaluation · SOPs and handoff documentation

Education

University of North Texas — B.A. in Sociology; minors in Economics and History.

Brooklyn Law School — Coursework toward J.D., 2014–2017; degree not conferred.

CHRIS MCNOSKY / OPEN-SOURCE CONTRIBUTION

Tokio
Simpler cross-platform code

Requirements, testing, judgment, and upstream acceptance

APPROVED AND MERGED • OCTOBER 21, 2026

The problem

Tokio provides networking, timers, and task coordination for Rust applications. Its select! macro waits on multiple operations. A request opened in July 2021, rated hard by maintainers, sought branches that could be removed during compilation for particular platforms or optional features. Earlier attempts encountered fairness and parsing problems.

My contribution

I turned the request into required behavior, coordinated implementation and regression coverage, and followed maintainer questions through resolution. Before submission, a separate audit found a failing test configuration and missing coverage. I reversed the earlier go-ahead, required correction, and submitted the corrected candidate.

The accepted result

Developers can maintain one event-handling structure across builds instead of copying it for each platform or feature combination. Excluded branches are removed before storage and polling code are generated, while selection fairness and existing syntax remain intact. Tokio accepted the feature and tests into its main codebase.

How I verified it

Regression coverage addresses unavailable code, caller-specific features, parsing, asynchronous behavior, and the 64-branch limit. Upstream automated checks passed. To investigate a concern about exponential expansion, compiler probes on Rust 1.88.0 and 1.98.1 produced one final select! body with 10 and 64 enabled branches. These bounded measurements do not establish zero compilation overhead.

Value to an employer

This work demonstrates how I make an unfamiliar problem testable, challenge a favorable result when the evidence does not hold, and follow technical objections through to acceptance. Clear requirements and independent review can reduce avoidable rework; fewer duplicate code paths can reduce maintenance effort.

CHRIS MCNOSKY / OPEN-SOURCE CONTRIBUTION

Grafana
Repairing shared links

Technical project delivery and software quality

APPROVED AND MERGED • SEPTEMBER 25, 2026

The problem

Grafana helps teams monitor systems through dashboards. Its compatibility API could put a Kubernetes namespace such as org-5 into a shared link even though the redirect required the numeric organization ID 5. The recipient could remain in the wrong organization, and Grafana could fail to find the link.

My contribution

I translated the mismatch into required behavior across self-hosted Grafana, Grafana Cloud, and installations with custom URL paths. I directed implementation and regression coverage, reviewed the results, and followed the correction through upstream review and merge.

The accepted repair

The handler uses the authenticated request's numeric organization ID outside Grafana Cloud, omits the organization parameter for Cloud, and preserves configured application subpaths. Grafana accepted the fix into its main codebase and closed the tracked issue.

How I verified it

Five Go handler test cases cover the default namespace, matching and conflicting organization namespaces, and Cloud with and without an organization ID. The matching-namespace case also checks a configured subpath. These tests check both the reported failure and adjacent configurations that a narrow fix could otherwise miss.

External review

The pull request received maintainer approval and was merged as commit 6a03817. The final-head check rollup had no failures, and issue #130873 closed on merge. The public record exposes the implementation, tests, discussion, and accepted result.

Value to an employer

A useful repair must address the reported failure without breaking another supported setup. This contribution demonstrates translating a user-visible problem into precise requirements, checking configuration differences, and carrying the work through external review.
