PROFESSIONAL SUMMARY

Solves unfamiliar technical and operational problems by defining requirements and selecting the needed expertise, tools, and evidence. Coordinates implementation and separate review, then follows the work through correction and acceptance. Merged Tokio and Grafana contributions provide proof; experience also spans AI evaluation, research, data, documentation, purchasing, and business operations.

SELECTED PROJECT RESULTS

- **Led a Tokio feature request rated hard through approval and merge.** Defined conditional select! behavior, coordinated implementation and regression tests, and answered maintainer concerns with compiler measurements. The feature avoids duplicating event-handling logic across platform-specific builds. Tokio PR #8374
- **Directed a Grafana shared-link repair through approval and merge.** Defined behavior across self-hosted Grafana, Grafana Cloud, and configured subpaths; coordinated implementation and regression tests; and followed the repair through upstream review. The fix prevents affected links from using the wrong organization identifier. Grafana PR #131070
- **Published eight inspectable Cleargrain Docs work samples.** Downloadable workbooks, a research comparison, and an SOP show data cleanup, supplier reporting, catalog preparation, records analysis, and written handoffs with traceable sources and documented checks. Cleargrain work examples

PROFESSIONAL EXPERIENCE

Founder - Cleargrain Docs | 2026-Present

- Define service scope, deliverables, acceptance checks, revision limits, and handover requirements for document, research, and spreadsheet work.
- Test and verify the review workspace with owned synthetic records covering private intake, scanned file exchange, versioned previews, feedback, exact-version approval, and release controls.

Founder / Full Stack Web Developer / AI Evaluation & Governance - NoFuckery AI | 2026-Present

- Translate unfamiliar goals into specifications, failure cases, and acceptance criteria; direct implementation and separate review using source changes, tests, logs, and required regression coverage.
- Co-created and released Read Shruti, a three-book author website; own architecture, API validation, search metadata, and aggregate analytics across its Next.js/React, TypeScript, Cloudflare Workers, and D1 system.

Founder / Sole Operator - High Pie | October 2022-Present

- Run sourcing, supplier selection, production, pricing, inventory, fulfillment, and customer issue resolution; maintain compliance documentation for a hemp-product business.

Purchasing Coordinator - Lennar | May 2018-October 2022

- Reconciled cost and documentation discrepancies across bids, contracts, budgets, and vendor records before field execution.
- Coordinated vendors, trades, and internal stakeholders against construction deadlines and cost, quality, documentation, and compliance requirements.

CORE SKILLS

Technical project delivery: problem framing; expertise and tool selection; requirements; workflow design; acceptance criteria; implementation coordination; review and release decisions

Software quality and evaluation: test strategy; end-to-end and adversarial testing; failure analysis; regression testing; AI evaluation

Research, data and documentation: source evaluation and citation; data cleanup and reconciliation; exception logging; SOPs; handoff documentation; document QA; Excel, Power Query, and Power Pivot

Technical review: source changes; tests and logs; pull-request review; Git/GitHub; CI

EDUCATION

University of North Texas - B.A. in Sociology; minors in Economics and History.

Brooklyn Law School - Coursework toward J.D., 2014-2017; degree not conferred

CHRIS MCNOSKY / OPEN-SOURCE CONTRIBUTION

Grafana: repairing shared links

Technical project delivery and software quality

Approved and merged into Grafana main.

Reviewer nmarrs: "LGTM" / Merged September 25, 2026

Read the approval and public discussion

THE PROBLEM

Grafana's compatibility API could put a Kubernetes namespace such as org-5 into a shared link even though the redirect required the numeric organization ID 5. The recipient could remain in the wrong organization, and Grafana could fail to find the link.

MY CONTRIBUTION

I translated the reported mismatch into required behavior across self-hosted Grafana, Grafana Cloud, and configured subpaths. I directed implementation and regression coverage, reviewed the results, and followed the change through upstream review and merge.

THE REPAIR

The merged handler uses the authenticated numeric organization ID outside Grafana Cloud, omits the parameter for Cloud, and preserves configured application subpaths.

THE EVIDENCE

Regression tests cover the affected configurations. The Go handler tests exercise the default namespace, matching and conflicting organization namespaces, Cloud with and without an organization ID, and a configured subpath.

External review confirmed the result. PR #131070 received an approving review and was merged into Grafana main as commit 6a03817. The final-head check rollup had no failures, and issue #130873 closed on merge.

WHY IT MATTERS

Reliable shared links depend on consistent organization identifiers across deployment types. Explicit requirements and configuration-specific tests reduce the chance that a narrow repair will break Cloud or custom-subpath setups.

STATUS VERIFIED OCTOBER 27, 2026

Approved and merged upstream. The tracked compatibility issue is closed.

CHRIS MCNOSKY / OPEN-SOURCE CONTRIBUTION

Tokio: simpler cross-platform code

Requirements, testing, judgment, and upstream acceptance

Approved and merged into Tokio upstream.

Darksonn / Approving maintainer / October 21, 2026

Read the approving review and public discussion

THE PROBLEM

Tokio provides networking, timers, and task coordination for Rust applications. Its select! macro waits on multiple operations. A 2021 request, labeled E-hard, sought branches that could be removed during compilation for particular platforms or optional features. Earlier attempts encountered fairness and parsing problems.

MY CONTRIBUTION

I turned the request into required behavior, coordinated implementation and regression coverage, used compiler probes to answer the expansion concern, and followed maintainer questions through resolution. Before submission, a separate audit found a failing test configuration and missing coverage. I reversed the earlier go-ahead, required correction, and submitted only the corrected candidate.

WHY IT MATTERS

The merged feature lets developers maintain one event-handling structure across builds instead of copying it for each platform or feature combination. Excluded branches disappear before storage and polling code are generated, while selection fairness and existing syntax remain intact.

Value to an employer. Clear requirements and independent review can reduce rework before release. Fewer duplicate code paths can reduce maintenance cost, leaving more engineering capacity for product work. This contribution shows the judgment and follow-through needed to turn an ambiguous request into accepted upstream code.

THE EVIDENCE

Tests cover unavailable code, caller-specific features, parsing, asynchronous behavior, and the 64-branch limit. Upstream CI passed. Compiler probes on Rust 1.88.0 and 1.98.1 produced one final select! body with 10 and 64 enabled branches, directly testing the reported risk of exponential code expansion.

STATUS VERIFIED OCTOBER 27, 2026

Approved and merged as de7a96a. Issue #3974 closed on merge.
